

AI PRODUCT PORTFOLIO

Vineet Jindal

Engineer by training. Product builder by practice.

DTU Mathematics & Computing graduate with 3+ years at Samsung R&D across Android systems and on-device AI. I use that technical foundation to understand user problems, define products, test assumptions and build AI-enabled experiences.

WHAT I BRING

Product Discovery - user conversations, problem framing, market and competitor research, hypotheses, MVP definition.

AI / ML - on-device AI, TensorFlow Lite, quantization, pruning, LRCN, image processing, AI prototyping.

Execution - PRDs, workflows, prioritization, trade-offs, validation planning, cross-functional thinking.

Systems - Android/ADB, root-cause analysis, thermal/reset behavior, reliability, workflow automation.

Marketplace - supply-demand research, pricing/payout economics, positioning, hyperlocal GTM validation.

Technical - Python, C, C++, JavaScript, Node.js, Express.js, MongoDB, MySQL, Git.

CURRENT TARGET

AI Product Manager / Product Manager roles where technical feasibility, customer understanding and AI product execution meet.

CASE STUDY 01

Android Sanity Automation

Samsung R&D | Python + ADB | System performance | Workflow automation

PROBLEM

Engineers manually connected devices, ran ADB/grep commands, exercised apps, collected CPU, memory, performance and thermal parameters across Android versions, and populated comparison spreadsheets.

APPROACH

Proposed and built a Python/ADB workflow that automated device actions, parameter collection, cross-version comparison and multi-sheet Excel report generation with anomaly highlighting.

PRODUCT LENS

Started from repetitive user pain inside the engineering workflow, defined the useful output, automated the highest-friction steps, and made deviations easy to inspect.

OUTCOME

Replaced a tedious manual device-to-report process with an automated workflow.

CASE STUDY 02

AI GIF Event Detection

Samsung R&D | LRCN | TFLite | Dataset creation | Android integration

PROBLEM

Detect meaningful gaming events such as kills, level completion or match outcomes and preserve relevant moments as GIF highlights.

ROLE

Worked in a six-member team and owned seven games in the workstream: gameplay recording, frame extraction and labeling, LRCN-based model training, TFLite conversion, Android integration and testing.

ITERATION

Investigated capture failures, refined event logic and supported QA feedback loops across different game behaviors.

PRODUCT LENS

Translated different user and game experiences into event definitions while balancing model quality with mobile deployment constraints.

OUTCOME

Supported India and Korea QA toward commercial launch consideration.

SnapAI: Smart Capture to Marketplace

PRD | User discovery | Market research | MVP | AI workflow | GTM validation

PROBLEM

For small events, trips and everyday moments, someone often stays behind the camera; professional photography can feel expensive or cumbersome for short, spontaneous needs.

V1

Started with an unattended AI Smart Capture concept: place a phone on a stand, capture important moments automatically, then curate and edit the album.

DISCOVERY

User conversations exposed a core limitation: real events move. Occlusion, changing angles and unpredictable moments make fixed unattended capture unreliable.

PIVOT

Reframed SnapAI as an on-demand capture marketplace: a human captures the moment while AI supports quality, culling, editing, curation and delivery.

PM WORK

Completed PRD work; customer and photographer discovery; competitor and market research; pricing and supply-economics analysis; MVP design and real-world validation.

EARLY VALIDATION

AI culling/editing workflow tested on approximately 120 photos; current focus is willingness-to-pay and supply validation.

OTHER PRODUCT / AI WORK

AI CL Analyzer - code-change/wiki summarization and build checking concept.

Delta Merge Tool - automation to verify model-specific code across Android-version paths.

Profile Pilot - privacy and multi-user profile concept selected by HOD for further senior review.

EXPERIENCE & EVIDENCE

2024-2026 Software Development Engineer, Samsung R&D Institute India - Noida

Android heating/reset analysis, on-device AI, AI feature development, developer tooling and customer VOC diagnosis.

2023-2024 Software Engineering Intern, Samsung R&D Institute India - Noida

Android sanity automation; Android platform fundamentals; Professional-level DSA assessment; DTU batch representative/mentor.

2026-Present SnapAI - Founder & Product Builder

PRD, customer/supply discovery, competitor research, MVP workflow, AI culling/editing, pricing/economics and GTM validation.

EDUCATION & RECOGNITION

Delhi Technological University - B.Tech, Mathematics & Computing, 2023 | CGPA 8.1

Samsung Professional-level DSA assessment - Rs. 50,000 incentive | Samsung internal recognition.

LeetCode all-time best rank 11,741 | HackerBlocks rank 2,452 / 56,400 | JEE Advanced AIR 11,680
